

DENISON HYDRAULICS

Seat Valve Cartridges CVD, Control Covers CVC

Pressure Relief Function / Cavity conform to DIN 24342

Publ. 3-EN 2450-A, replaces 3-EN 245-B

FEATURES, DESCRIPTION

FEATURES

- Pilot operated relief valve function with excellent balanced pressure characteristics.
- Low pressure drop in vented condition (see curves).
- All functions designed for an operating pressure of 350 bar or more.
- Low pressure overshoot owing to fast response.
- **DIN Cartridge Kit**
 - standardized installation dimensions according to DIN 24342
 - comprises poppet, sleeve, spring, ring and seals
 - O-ring and backup ring combination provide for a trouble free seal.
- **DIN Control Cover Versions**
 - with integrated pilot valve
 - for mounting of 4/2-directional valve CETOP 03 (4D01 or A4D01) for control of vent function
 - for mounting of proportional pressure valve CETOP 03 with position feedback (R1EP01)
 - for mounting of proportional pressure valve CETOP 03 without position feedback (4VP01).

A = Working port (pressure)
 B = Working port (tank)
 X = Pilot port
 Y = Drain port

DESCRIPTION

Relief valves of the CV* design are also based on the pilot operated 2/2 seat valves. Their applications are in manifold block systems. Cavity and installation dimensions are according to DIN 24342 standard.

The area ratio of the cartridge assembly $A_A : A_X = 1 : 1$.

The control cover with the standard pilot option contains the complete pressure control assembly with adjustment options of control knob, acorn nut with locking wire or key lock device. Five cover options with various pilot connections are available.

By use of the suitable pilot valves R1EP01 or 4VP01 the DENISON CV* valves can be operated electro-proportionally (see also page 9).

OPERATION

Pressure relief valves limit the hydraulic pressure in a system. Depending on system pressure they open or close effectively preventing excessive pressure build up.

The system pressure in port A acts on the bottom surface A_A of the main poppet. The orifice plug in connection X allows an equal pressure to be applied to the top surface Z of the main poppet. At operating pressure lower than setting the main poppet is, therefore, hydraulically balanced. A relative light spring holds the main poppet against the seat.

Simultaneously the pressure in Z also acts on the cone of the pilot head which in turn is held against the seat by a preloaded spring.

The setting of the adjustable preloaded spring plus the spring which holds the main poppet closed determines the pressure setting of the valve. If the system pressure exceeds this set value the pilot cone is pushed off its seat and pilot oil flows via the Y port to the tank. The flow through the control orifice in X creates a pressure drop which results in the pressure at the top of the main poppet being reduced.

The higher system pressure in A now lifts the main poppet of its seat. In the resulting float position only enough flow is passed from A to B to maintain the inlet pressure in A, as determined by the pilot head setting. If the pressure falls below its setting the main poppet is pushed against back the seat. The valve is once again closed.

By means of a 4/2 directional valve the top side of the main poppet Z can be vented to tank allowing virtually free flow from A to B, at a low Δp .

Using a proportional pilot valve on top of the cover, the operating pressure is electro-proportional adjustable. The hydraulic-mechanical pilot valve within the control cover should be set 10% higher as the max. operating pressure.

- 1) Cover parts (adjusting devices, pilot heads) can exceed dimension b_1 and b_2 .
- 2) Port B can vary around the centre line of port A.
Note:
Holes for mounting screws and pilot oil must not be damaged.
- 3) Drilling depth and drilling angle of pilot ports are related to circuitry and arrangement of valves within the manifold.
- 4) Recommended depth of screw (minimum) for cast iron is dia. of thread times 1.25.
- 5) Close-tolerance work depth.
