GENERAL CHARACTERISTICS

CONSTRUCTION	Fixed displacement radial piston motor
TYPE	MRT, MRTE, MRTF
MOUNTING	Front flange mounting
CONNECTION	Connection flange
MOUNTING POSITION	Any (please note the installation notes on page 22)
DIRECTION OF ROTATION	Clockwise, anti-clockwise -reversible
FLUID	HLP mineral oils to DIN 51 524 part 2; Fluid type HFB, HFC and Bio-fluids on enquiry. FPM seals are required with phosphorous acid-Ester (HFD)
FLUID TEMPERATURE RANGE	t °C – 30° a + 80°
VISCOSITY RANGE ¹⁾	ν mm ² /s 18 to 1000: Recommended operating range 30 to 50 mm ² /s (see fluid selection on page 6)
FLUID CLEANLINESS	Maximum permissible degree of contamination of fluid NAS 1638 Class 9. We therefore recommend a filter with a minimum retention rate of $\beta_{10} \geq 75$. To ensure a long life we recommend class 8 to NAS 1638. This can be achieved with a filter, with a minimum retention rate of $\beta_5 \geq 100$.

1) For different valves of viscosity please contact DENISON Calzoni

FUNCTIONAL DESCRIPTION

The outstanding performance, which is already known in our MR - MRE series motors, is the result of an original and patented design. The principle is to transmit the effort from the stator to the rotating shaft (1) by means of a pressurized column of oil (A) instead of the more common connecting rods, pistons, pads and pins. This oil column is contained by a telescopic cylinder (2) with a mechanical connection at the lips at each end which seal against the spherical surfaces (3) of the cylinder-heads (4) and the spherical surface of the rotating shaft (1). These lips retain their circular cross section when stressed by the pressure so there is no alteration in the sealing geometry. The particular selection of materials and optimisation of design has minimized both the friction and the leakage. Another advantage of this design stems from the elimination of any connecting rods, the cylinder can only expand and retract linearly so there are no transverse components of the thrust. This means no oval wear on the moving parts and no side forces on the cylinder joints. A consequence of this novel design as a 10 piston motor is the significant reduction in dimensions. Especially the diameter is limited to a value of motors with half of its capacity. Performances reached by this motor type are improved with reference to other motors of same displacement. Another advantage stems from the geometrical arrangement of the 10 - 14 pistons, that results in a static balance of the motor shaft and in a great reduction of the reaction forces on the bearings with consequent large extension of their life time.

TIMING SYSTEM

The timing system is realized by means of a rotary valve (5) driven by the rotary valve driving shaft (8) that it is connected to the rotating shaft. The rotary valve rotates between the rotary valve plate (6) and the reaction ring (7) which are fixed with the motor's housing. This timing system is also of a patented design being pressure balanced and self compensating for thermal expansion. The motor sizes from MRTE 16500 to MRTE 23000 are available with large timing system option that allows higher motor power performances as well as the possibility to have a throughhollow shaft (see pages 5, 18-19).

EFFICIENCY

The advantages of this type of valve coupled with a revolutionary cylinder arrangement produce a motor with extremely high values of mechanical and volumetric efficiency. The torque output is smooth even at very low speed and the motor gives a high performance starting under load.

EXAMPLE: At a certain ambient temperature, the operating temperature in the circuit is 50°C. In the optimum operating viscosity range (v_{rec} ; shaded section), this corresponds to viscosity grades VG 46 or VG 68; VG 68 should be selected.

IMPORTANT: The drain oil temperature is influenced by pressure and speed and is usually higher than the circuit temperature or the tank temperature. At no point in the system, however, may the temperature be higher than 80°C.

If the optimum conditions cannot be met due to the extreme operating parameters or high ambient temperature, we always recommend flushing the motor case in order to operate within the viscosity limits.

Should it be absolutely necessary to use a viscosity beyond the recommended range, you should first contact DENISON Calzoni for confirmation.

GENERAL NOTES

More detailed information regarding the choice of the fluid can be requested to DENISON Calzoni. Further notes on installation and commissioning can be found on page 34 of this data sheet. When operating with HF pressure fluids or bio-degradable pressure fluids possible limitations of the technical data must be taken into consideration, please see information sheet TCS 85, or consult DENISON Calzoni.

The viscosity, quality and cleanliness of operating fluids are decisive factors in determining the reliability, performance and life-time of an hydraulic component. The maximum life-time and performance are achieved within the recommended viscosity range. For applications that go beyond this range, we recommend to contact DENISON Calzoni.

$$v_{rec.} = \text{recommended operating viscosity } 30\ldots50 \text{ mm}^2/\text{s}$$

This viscosity refers to the temperature of the fluid entering the motor, and at the same time to the temperature inside the motor housing (case temperature). We recommend to select the viscosity of the fluid based on the maximum operating temperature, to remain within the recommended viscosity range. To reach the value of maximum continuous power the operating viscosity should be within the recommended viscosity range of 30 - 50 cSt.

For limit conditions the following is valid:

$$v_{min.abs.} = 10 \text{ mm}^2/\text{s} \text{ in emergency, short term}$$

$$v_{min.} = 18 \text{ mm}^2/\text{s} \text{ for continuous operation at reduced performances}$$

$$v_{max.} = 1000 \text{ mm}^2/\text{s} \text{ short term upon cold start}$$

The operating temperature of the motor is defined as the greater temperature between that of the incoming fluid and that of the fluid inside the motor housing (case temperature). We recommend that you choose the viscosity of the fluid based on the maximum operating temperature, to remain within the recommended viscosity range (see diagram). We recommend that the higher viscosity grade must be selected in each case.

The motor life also depends on the fluid filtration. At least it must correspond to one of the following cleanliness.

class 9 according to NAS 1638

class 6 according to SAE, ASTM, AIA

class 18/15 according to ISO/DIS 4406

In order to assure a longer life a cleanliness class 8 to NAS 1638 is recommended, achieved with a filter of $\beta_5=100$. In case the above mentioned classes can not be achieved, please consult us.

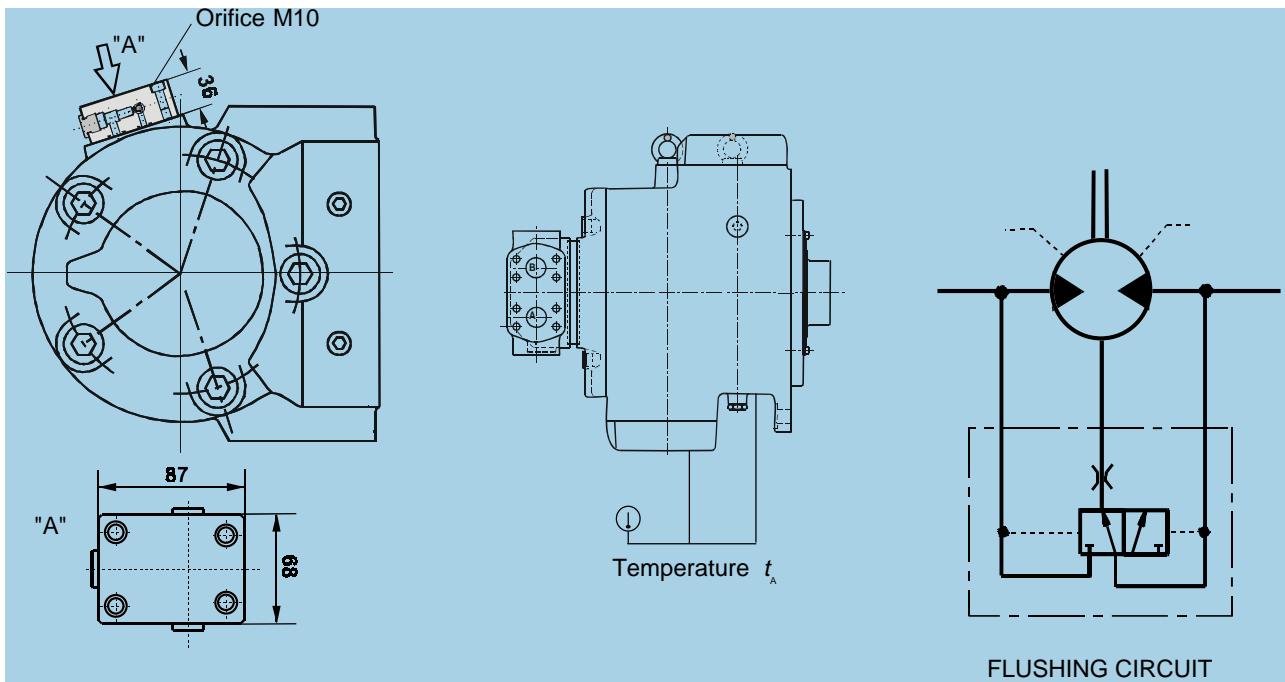

The lower the speed and the case drain pressure, the longer the life of the shaft seal. The maximum permissible housing pressure is

$$p_{max} = 5 \text{ bar}$$

If the case drain pressure is higher than 5 bar it is possible to use a special 15 bar shaft seal (see page 23, Seals, Code "F1").

In case of operating conditions with high oil temperature or high ambient temperature, we recommend to use "FPM" seals (see page 23, Seals, Code "V1"). These "FPM" seals should be used with HFD fluids.

"FPM" SEALS

FLUSHING PROCEDURE

In order to achieve the maximum continuous performance values the flushing of the housing is necessary (see diagrams pages 8 to 12).

Under special conditions, in order to achieve the recommended operating viscosity of 30 - 50 mm²/s in the motor housing, the flushing of the motor may be necessary also in the "operating area without flushing" see page 6 and the "operating diagram" page 7 to 12.

NOTE1:

The oil temperature inside the motor housing is obtainable by adding 3° C to the motor housing surface temperature, measured between two cylinders (t_A , see figures).

FUNCTION:

The flushing valve takes the flushing flow always from the low pressure line of the motor. The diameter of the orifice has to be chosen in order to supply the recommended quantity of flushing flow of 23 l/min.

BACK PRESSURE (bar)	ORIFICE DIAMETER (mm)
3	4,8
6	4,0
9	3,6
15	3,2
20	3,0
25	2,9
30	2,8

NOTE2:

The flushing valve is delivered with a "closed" orifice.

Caution:

Flushing does not work until the "closed" orifice is replaced by the proper one.

Encoder type:	ELCIS mod. 478
Supply voltage:	8 to 24 Vcc
Current consumption:	120 mA max
Current output:	10 mA max
Output signal:	A phase- MONODIRECTIONAL A and B phase BIDIRECTIONAL
Response frequency:	100 KHz max
Number of pulses:	500 (others on request - max 2540)
Slew speed:	Always compatible with maximum motor speed
Operating temperature range:	from 0 to 70 °C
Storage temperature range:	from -30 to +85 °C
Ball bearing life:	1.5x10 ⁹ rpm
Weigth:	100 gr
Protection degree:	IP 67 (with protection and connector assembled)
Connectors:	
MONODIRECTIONAL	RSF3/0.5 M (Lumberg) RKT3-06/5m (Lumberg)
BIDIRECTIONAL	RSF4/0.5 M (Lumberg) RKT4-07/5m (Lumberg)
	male female male female

Note: Female connectors cable length equal to 5 m.

Mounting

Any mounting position

- Note the position of the case drain port (see below)

Install the motor properly

- Mounting surface must be flat and resistant to bending

Min. tensile strength of mounting screws to DIN 267 Part 3 class 10.9

- Note the prescribed fastening torque

Pipes, pipe connections

Use suitable screws!

- Depending on type of motor use either threaded or flange connection

Choose pipes and hoses suitable for the installation

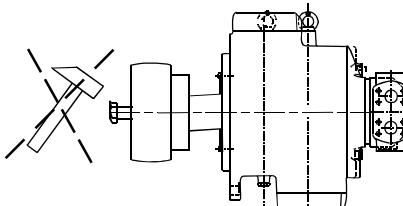

- Please note manufacturing data!

Before operation fill with hydraulic fluid

- Use the prescribed filter!

Note: Two of the mounting screws must be precisely located/fitted if operation is started and stopped frequently or if high reversible frequencies exist.

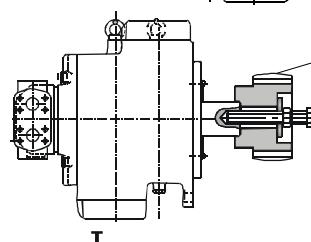

Coupling

Mounting with screws

Use thread bore in the drive shaft

Take apart with extractor

Curved tooth coupling hub

Screw to remove the coupling hub

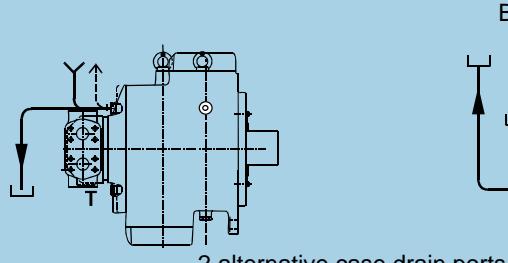

DRAIN AND FLUSHING LINK INSTALLATION EXAMPLES

Note: Install leakage line in such a way that motor **cannot** run empty.

T = Seal
Y = Motor housing feeding point
← = Bleed

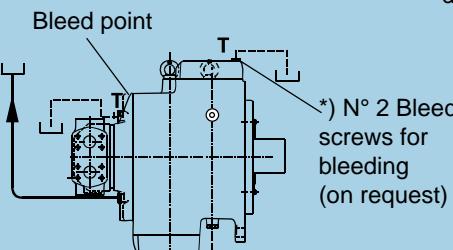

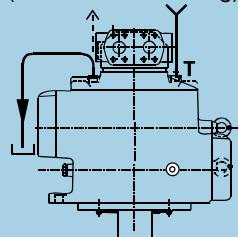

Note: Install leakage line in such a way that motor **cannot** run empty.

Low pressure case drain returns to tank

2 alternative case drain ports in the first cylinder row at 120° one from another

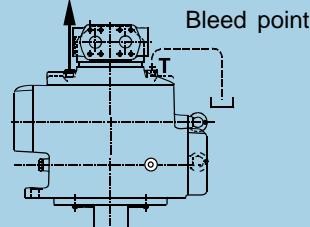

(release for bleeding)

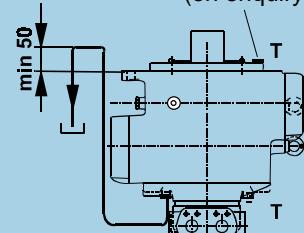

Cooling circuits for heavy duty continuous operation

Flushing $p_{\max} = 5$ bar with standard shaft seal

Overhead tank

*) Bleed screw (on enquiry)

Choose drain port in order to allow the complete filling of the housing with hydraulic fluid.

*) Special designs for applications, where the equipment needs to be filled with oil.(e.g. in a salty atmosphere)
